[Histamine in the brain](#) Jian-Sheng Lin 2015-03-18 Brain aminergic pathways are organized in parallel and interacting systems, which support a range of functions, from homeostatic regulations to cognitive, and motivational processes. Despite overlapping functional influences, dopamine, serotonin, noradrenaline and histamine systems provide different contributions to these processes. The histaminergic system, long ignored as a major regulator of the sleep-wake cycle, has now been fully acknowledged also as a major

coordinator of attention, learning and memory, decision making. Although histaminergic neurons project widely to the whole brain, they are functionally heterogeneous, a feature which may provide the substrate for differential regulation, in a region-specific manner, of other neurotransmitter systems. Neurochemical preclinical studies have clearly shown that histamine interacts and modulates the release of neurotransmitters that are recognized as major modulators of cognitive processing and motivated behaviours. As a consequence, the histamine system has been proposed as a therapeutic target to treat sleep-wake disorders and cognitive dysfunctions that accompany neurodegenerative and neuroinflammatory pathologies. Last decades have witnessed an unexpected explosion of interest in brain histamine system, as new receptors have been discovered and selective ligands synthesised. Nevertheless, the complete picture of the histamine systems fine-tuning and its orchestration with other pathways remains rather elusive. This Research Topic is intended to offer an inter-disciplinary forum that will improve our current understanding of the role of brain histamine and provide the fundamentals necessary to drive innovation in clinical practice and to improve the management and treatment of neurological disorders.

Le corps caché, secret, économisé est devenu le corps dénudé, transparent et entretenu par le mouvement ; il est désormais le bien ultime de l'individu, dont le maintien en santé constitue l'objectif essentiel. A partir d'exemples européens, africains et chinois, ce livre propose une lecture croisée du rôle des acteurs, des patients mais aussi des membres des professions médicales et des institutions dans ce changement collectif et progressif. Il montre aussi quelles sont les conditions qui ont conduit à la situation médicale et sanitaire actuelle des pays riches.

**Uroscopy in Early Modern Europe** Michael Stolberg 2016-03-03 Uroscopy - the diagnosis of disease by visual examination of the urine - played a very prominent role in early modern medical practice and in the lives of ordinary people. Widely considered as the most reliable way to diagnose diseases and pregnancies it was taught at the best universities. Leading physicians prided themselves on their mastery in this field. Countless medical writings were dedicated to uroscopy and artists represented it in hundreds of illustrations and paintings. Based on a wide range of textual and visual sources, such as autobiographies, court records, medical treatises and genre painting, this book offers the first comprehensive study of the place of uroscopy in early modern medicine, culture and society and of the - gradually changing - ways in which medical practitioners, lay persons and, last but not least, artists perceived and used it.

**How Tobacco Smoke Causes Disease** 2010 This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
